

JRG COLLEGE OF PHARMACY

UNIVERSITY SOLVED QUESTION WITH ANSWER

Year : 2019-2020

Subject : Pharmaceutics

Subject Code : BP-103T

Subject In-Charge : Adyasha Senapati & Monali Padhi

Registration No:

--	--	--	--	--	--	--	--

Total Number of Pages : 01

**B.Pharm
BP103T**

1st Semester Regular/Back Examination 2019-20
PHARMACEUTICS-I
BRANCH : B.Pharma
Max Marks: 75
Time : 3 Hours
Q.CODE : HRB707

Answer Question No.1 (Part-A) and 02 (Part-B) which are compulsory and any TWO from Part-C.

The figures in the right hand margin indicate marks.

Part-A

- Q1 Only Short Answer Type Questions (Answer All-10) (2 x 10)**
- a) How you can calculate child dose according to dilling's formula?
 - b) Why clicking sound is found in emulsion preparation?
 - c) Name the two reasons responsible for physical incompatibility.
 - d) Write down the composition of flexible collodions.
 - e) Convert 50% alcoholic preparation to proof spirit.
 - f) Name the emulsion identification tests.
 - g) What is tablet triturate?
 - h) Why tetracycline is not taken with milk for therapeutic use?
 - i) Give two examples of preservatives mostly used in suspension.
 - j) What is compound tragacanth?

Part-B

- Q2 Only Focused-Short Answer Type Questions- (Answer Any SEVEN out of NINE) (7 x 5)**
- a) Explain the various solubility enhancement techniques
 - b) Discuss the stability problems of emulsion
 - c) Illustrate the evaluation of Ointment.
 - d) Differentiate between suspension and emulsion
 - e) Draw a typical format of prescription and mention the importance of its each part
 - f) Calculate the quantity of 40% v/v and 70% v/v alcohol are required to make 200 ml of 50% v/v alcohol.
 - g) Differentiate between Ointment and Cream
 - h) Discuss the formulation procedure of the elixir
 - i) 15 kg weighing child of 5 years age is to be treated with paracetamol whose adult dose is 500mg, then what will be the child dose? Compare the results obtained from two different formulae.

Part-C

- Q3 Only Long Answer Type Questions (Answer Any TWO out of FOUR) (10)**
- What is posology? Mention various factors affecting dose calculation.
- Q4 Classify 'Incompatibility'? Discuss different types of 'chemical Incompatibility' with remedy. (10)**
- Q5 What are semisolid dosage forms? Write in detail about Suppositories. (10)**
- Q6 Define powder, classify it and briefly discuss it. (10)**

2 marks - 2019-20

1) How you can calculate child dose according to Drings formula?

A) According to Drings Formula Dose of the child.

$$\text{formula} - \frac{\text{Age in yr}}{20} \times \text{Adult dose}$$

Ex: The child age is 12 years adult dose 500 mg
then the dose of the child.

$$\frac{12}{20} \times 500 = 300 \text{ mg}$$

2) Why clicking sound is found in emulsion preparation

A) When a clicking sound is formed in the emulsion preparation it form a hard and thick cream.
So clicking sound found in emulsion.

B) Name two reason responsible for physical incompatibility?

A) Physical incompatibility in pharmaceutical can arise from various factor but two common reason are.

1. phase separation - This occurs when two or more components of a formulation separate into phases.

Ex: An emulsion the oil and water phases may separate due to improper emulsification or incompatibility between the components. Phase separation can lead to uneven distribution of the drug / that affect efficacy.

2. Crystallization: Incompatibility can also result from the crystallization of one or more components or a formulation. This can occur when two substance interact to form insoluble crystal when a single component crystallizes out of solution. Crystallization can alter the appearance, stability and bioavailability of the drug product.

d) write down the composition of Frexidol colloids?

$$\text{Ans: } \text{Frexidol colloids} = 30\% \text{ Frexidol} + 20\% \text{ Glycerine} + 20\% \text{ Water} + 10\% \text{ Benzyl Alcohol}$$

e) convert 50% alcoholic preparation to proof spirit?

$$A) \text{Proof Strength} = \frac{1}{1.753} \times 100$$

$$= 50 \times 1.753 - 100$$

$$= 87.65 - 100$$

$$= 12.35^{\circ} \text{ OP}$$

f) Name the emulsion identification test?

A) The emulsion identification test is called Shake test as the identification tests are

- Dilution test

- Conductivity test

- Dye test

- Fluorescence test

g) What is tablet triturate?

- A) Tablet triturate refers to a method of preparing tablets by grinding or crushing the active ingredients into a fine powder and then mixing with them with a suitable base to form a tablet.
- This method is commonly used when active ingredients are not easily compressible into a solid tablet form.

h) Why tetracycline is not taken with milk for therapeutic use?

- A) Tetracycline is not taken with milk for therapeutic use because it can interfere with absorption in the body. calcium rich foods, such as milk can form insoluble complexes with tetracycline in the stomach reducing its absorption into the blood stream and decreasing its effectiveness. It is usual advised to take tetracycline on empty stomach.

i) Give two examples of preservatives mostly used on ~~pass~~ suspension

- i) The most common preservatives used on suspension is sodium benzoate and sorbic acid or potassium sorbate.

j) What is compound tragacanth?

- i) Compound tragacanth is also known as tragacanth gum, is a natural gum obtained by the dried sap of several species of middle eastern legumes in the genus *astragalus*.

-) Discuss the stability problems of Emulsion,
-) The following changes usually occurs which affect the stability of emulsion.
- 1) Cracking
 - 2) Creaming
 - 3) Phase conversion
 - 4) Coalescence

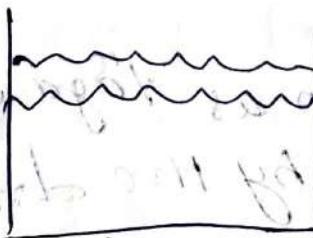

Cracking

- Cracking means the separation of two layers / phases of the emulsion (dispersed phase and continuous phase).
Cracking may be occurs due to:
- 1) Addition of wrong emulsifying agent.
 - 2) growth of microorganism.
 - 3) Change in temp / nature.

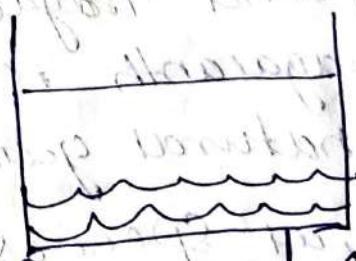

Creaming

Creaming can be defined as upward movement or downward movement of dispersed phase (dispersed globules) to form a thick layer.

- o/w emulsion - upward creaming
- w/o emulsion - downward creaming

Upward creaming
o/w

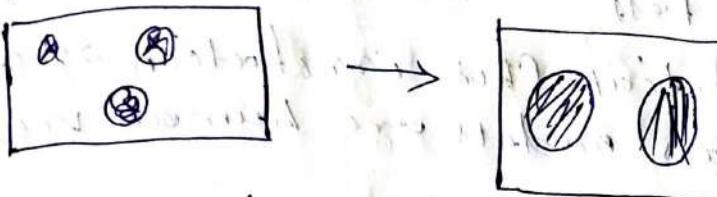

Downward creaming
w/o emulsion

Inversion
Inversion simply defined as conversion of oil/water emulsion into w/o Emulsion or vice versa (w/o emulsion to O/w emulsion)

Coalescence

Coalescence is the process in which two or more droplets merge together to form a single large droplet.

Illustrate the evaluation of ointment

Physico Chemical Properties

A) Appearance - Observe the colour, texture and homogeneity of the ointment.

B) pH measurement - Determine the pH level to ensure it is within the acceptable range for topical application

C) Stability testing -

A) Accelerated stability testing -

Store the ointment at elevated temperatures and humidity levels to stimulate long term storage conditions.

B) Shelf life testing - Assess the stability over a defined period under the normal storage conditions

3) Drug release and penetration

In vitro release studies

use a diffusion cell apparatus to measure the rate at which the active ingredient is released from the ointment.

4) Safety testing

Dermal irritation test

Evaluate any potential skin irritation or sensitization using animal models or human volunteerization.

d) Difference between Suspension and Emulsion?

Suspension

- It is a heterogeneous mixture of two immiscible liquids.
- Dispersed particle don't settle on standing.
- Dispersed particle size 1 to 100 nm.
- Particles are not visible through the naked eye.
- It cannot be separated by filtration.
- Dispersed in liquid and mixed or gay.
- Emulsifying agents are required.

Emulsion

- It is a heterogeneous mixture.
- Dispersed particle settle on standing.
- Dispersed particle size more than 100 nm.
- Particles are visible through the naked eye.
- It can be separated by filtration.
- Dispersed in liquid.
- Suspending agent are required.

(6) Define prescription with the help of ~~any example~~
Describe the important parts of prescription
A) Prescription is a written order from the physician
or medical practitioner to a pharmacist to compound
and dispense the medicine to the patient.

~~for ex~~ Example of prescriptions - NHS prescriptions
- private prescriptions
- hospital inpatients prescriptions
- hospital out prescriptions

Parts of prescription

Date : It is very important part of a prescription
it helps a pharmacist to find out the date of
prescribing and date of prescription. In case of
narcotic and habit forming drug, the date prevent
the misuse of drug by patient.

Name, age, sex Address of the patient

Name and address of the patient helps in identification
of patient while age and sex helps to
decide the dose for that particular patient.

Superscription

It is represented by 'Rx' symbol. It means
you take.

In olden days, the symbol was considered to
be originated from the sign of Jupiter the god
of healing. It is used for the first recovery
of the patient.

Inscription

- It is the main part of the prescription containing name and quantities of prescribed medicaments
- The name of each ingredient is written on a separate line along with its quantity

Subscription

- In this part prescriber gives direction to the pharmacist regarding to dosage form and number of dosage to be dispensed.

Signature :-

- In this part prescriber gives direction to the patient regarding the administration of drugs
- It contains also how it is administered & aged to
- Quantity / Amount & time to be taken
- Frequency of administration
- Special instruction such as dilution etc.

Renewal instructions

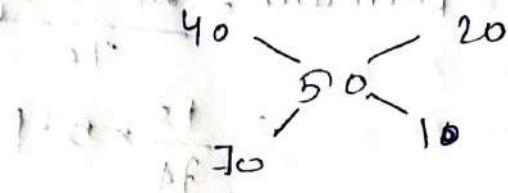

- In this point prescriber indicated whether the prescription may be renewed or not and upto then how many times

It is very important specially on the prescription containing narcotic and habit forming drug to avoid its misuse.

Registration no. of the prescriber, signature, Address, Registration no. of the prescriber

It is very important and much needed part of prescription verify that the prescription is official and issued by doctor

calculate the quantity of 40% v/v and 70% v/v which are required to make 200 ml. of 50% v/v ointment.

= Volume required x part

total part = 100 ml.

$$= \frac{200 \times 20}{100} = 40 \text{ ml}$$

$$\text{so, } 40 \text{ ml. of } 70\% \text{ v/v oil will be required.}$$

p) Difference between ointment and cream.

Cream

- water based, semisolid preparation.
- contains 50% oil and 50% water.
- non greasy, rich and heavy.
- thick liquid preparation.
- thick consistency.
- easily spreadable.
- rapidly absorbed.
- rapid onset action.
- easily warmed off.

ointment

- oil based semisolid preparation.
- contain 80% oil and 20% water.
- greasy, smooth and soft.
- soft semisolid prep.
- less spreadable.
- thinner consistency.
- not easily warmed off.

i) A) weight of the child - 15 kg
given adult dose - 500 mg

According to Clark's formula - $\frac{\text{wt in kg}}{70} \times \text{Adult dose}$

$$= \frac{15}{70} \times 500$$

$$= 107.5 \text{ mg}$$

otherwise

Age of the child - 5 year

Adult dose - 500 mg

Dose of the child - $\frac{\text{Age in yrs}}{20} \times \text{Adult dose}$

$$= \frac{5}{20} \times 500$$
$$= 125 \text{ mg}$$

According to Clark's formula result of the

child dose is 107.5 mg due to different formulae

result of the child dose is 125 mg due to dependent on the weight of child

- because more weight contains more power of dose

Q Define powder? and classify it briefly?

→ A pharmaceutical powder is a solid form of medicament which one means for it is used for internal or external use.

Classification of powder

- Based on particle size

- Based on use

- Based on physical form dispensing

Classification based on Particle size

On the basis of particle size powders are classified into 5 categories.

1) very coarse powder

2) coarse powder

3) moderate coarse powder

4) fine powder

5) very fine powder

very coarse powder — All particles pass through sieve no 8

coarse powder — 11 26

moderate coarse powder — 11 40

fine powder — 11 60

very fine powder — 11 80

Based on uses on the basis of uses powders are classified into 2 categories.

1) Powders for internal use

2) Powders for external use

Powders for internal use

- It consist the drug form of powder.
- Powder for internal use can be taken orally.
- Administered through nose or orally.

- It is divided into 2 types
1. simple powder
 2. compound powder

Powders for external use

Powders for external use are pharmaceutical preparation consisting of solid, loose dry particles of varying degree of fineness.

- They are usually applied outer body area.
 - They basically include
 - dusting powder
 - surgical powder
 - Dentofrices

Classification based on physical form

on the basis of physical form it is divided into 2 types

Bulk powder

- Bulk powder refers to a mixture OR material packed into properly designed bulk container such as tins & wide mouth glass / plastic bottles

Divided powders

- Divided powder are single dose of powder.
- Divided powder are separately packed.
- In divided powder each are

Ex : Eno, ORS

Q) Define factor affecting posology?
Ans -
Posology is the branch of medical science which deals with the dose or quantity of the drug which can be administered to a patient to get desired pharmaceutical action.

posos means - How much } greek word
logos - science }

factor affecting

Age is those of the drug is given according to age of patient.

- children require less dose as compare to adult.

sex : It is also affect the dose calculation because male and female have different criteria for dose and in ~~non~~ female at the time of pregnancy menstruation, lactation doses will be given, correctly.

Body size : It influences the concentration of drug in the body. Heavy weight person want high dose compare to person having low weight.

Route of administration : In case of IV injection less dose is required and in case of oral administration large dose is given.

Presence of disease : If the patient have many disease in the body affect the dose of the drug.

Times of administration : In empty stomach drug response quickly than filled stomach.
Absorption of drug is delayed by the presence of food stomach.

Synergism : When the effect of the drug which increased by the combination of two or more drugs it is called synergism ex: Ephedrine + Adrenalin.

Antagonism : When the action of one drug is decreased by another drug then it is known as antagonism. ex: Histamine + Adrenaline.

Polio-syndrome : Some person may produce abnormal reaction of drug after taking standard dose of a drug.

Tolerance : Some time higher dose of a drug is required to produce a normal pharmacological action.

and if not? What do you mean by incompatibility? Classify & describe about therapeutical incompatibility with its remedy? When two or more ingredients are mixed together to prepare a medicine and undesired change takes place which affect the physical, chemical and therapeutic properties of medicament then the phenomenon is called incompatibility.

Incompatibilities are usually unintentional.

Incompatibilities may occur during

- compounding
- formulation
- manufacturing
- packaging
- dispensing
- storage
- administration

Incompatibility can affect

- safety of medicament
- Efficacy of product
- Appearance of medicine
- Purpose of medicament

Types of pharmaceutical incompatibilities

- ① Physical incompatibilities
- ② Chemical incompatibility
- ③ Therapeutic incompatibility

Therapeutic incompatibility

Therapeutic incompatibility may be the result of prescribing certain drugs to the patient with the intention to produce a specific degree of action but the nature or intensity of the action produced is different from that intended by prescriber.

causes of therapeutic incompatibilities

- It may occur due to
 - overdose / improper dose of a single drug
 - improper dosage form
 - contraindicated drug
 - synergistic drug or antagonistic drug

Example of overdose

Codeine Phosphate - 0.5 gm

Direction for Pharmacist

- make powders
- send such 10 powders
- 1 dose to be taken on bed time

In the above prescription, physician write - 0.25 gm (0.5 gm) instead of 5 mg of codeine phosphate

A) Semisolid dosage forms are topical preparation used for therapeutic, protective or cosmetic function

- They are generally applied over the skin but can also be applied nasal, vaginal and rectally.
- Pharmaceutical semisolid dosage forms generally include ointments, pastes, creams and gels.
- They contain one or more active pharmaceutical ingredients dissolved or uniformly dispersed in a suitable place.

Advantage

- It is used externally hence probability of side effect is very less.
- First pass metabolism is avoided.
- Suitable for unconscious patient.
- Suitable dosage form for bitter drugs.
- More stable than liquid dosage form.

b) Suppositories ?

A) Suppositories is the semi-solid dosage form. It is the medicament used for insert to the body cavity like rectum, vaginal, urethral tract nasal cavity or ear cone.

- It is designed to melt or integrate or dissolve at body temperature after that it release the medicaments and it will show local systemic or mechanical action.

types of suppositories

- + Rectal suppositories
 - vaginal suppositories
 - urethral suppositories
 - nasal suppositories
- ear suppositories

Rectal suppositories - Pt is intent for placement into rectum for systemic effect.

- These often prepared from theobroma cacao butter (cocoa butter) - light yellow. Pt derive from cocoa beans.
- In case of adult the weight of suppositories weight 2 gm.
- In children case of 1 gm
- Cone or torpedo shaped.

vaginal suppositories - Pt is inserted into the vagina.

- Some time referred as Pessaries.
- They are bigger than rectal suppositories.
- In case of adult and children the avg weight 3-5 gm.
- conical or rod shaped.
- use treatment of vaginal infection.

urethral suppositories

- Inserted into the urethra.
- pencil like structure.
- Pt is also known as urethral bougies.
- In male wt 4 gm length 100-150 mm.
- In ~~female~~ female weight 2 gm length 60-75 mm

Nasal suppositories

- inserted into the Nasal cavity
- sometimes called nasal bougies

- produced with glycerol base.

- Avg wt male and female 1gm and length 9-10cm.
- It is thin and cylindrical shape.

ear suppositories

- inserted into the ear.

- also known as auricularies.

- weight 1gm.

- It is cylindrical in shape.

Advantage of suppositories

- utilized with unconscious patient.

- compact dose form

- lower risk of side effect.

- treat people who have severe nausea and vomiting.

- used to prevent rectal, vaginal, infections

Disadvantages of suppositories

- patient acceptance issue include suppositories not being appropriate for people with diarrhoea.

- In rare case administration of a large dose of a medicine cause irritation or exceed the capacity of suppositories.

- They must be stored at low temperature otherwise they will get melted.
